## ABSTRACT

The primary focus is on black persons, aged 65 or older. Almost 4,000 non-institutionalized black and white elderly comprised the final, nationwide sample. Various demographic data are presented, e.g., place of residence, income, marital status, education, religion, occupation, etc. for the entire sample and significant differences between black and white elderly are established. The unequal position of the black elderly is emphasized, much of it seen simply as the exacerbated continuation of earlier disadvantage. On the basis of the demographic data, as well as the results of testing his major hypotheses, the author concludes (1) that the black elderly are with us and their living conditions are in dire need of improvement; (2) that the black elderly are no more alone and isolated than the general elderly population; and (3) that the emotional state of well being (morale) is not significantly different for black elderly than for white elderly. Advanced Studies in Social Welfare  
Brandeis University  
Waltham, Massachusetts

Since the title of this symposium "Aging and Black Families" is most comprehensive, there is a need for me to direct you to my particular intent. I am focusing and commenting primarily on the Black elderly, the Black person who has aged chronologically to 65 years or more. My involvement with the Black family is based on the fact that the family and kin are the primary source for emotional support in the later years. Older people are expected to attach a relatively higher value to the emotional aspects of life as other social functions diminish. They are expected to develop a greater orientation to affective, expressive, and affectional goals (Rosow 1967). Consequently, the family and kinship system becomes the major social institution for the social participation of elderly people. At a time of life when one's emotional security is so greatly challenged (Simpson and McKinney 1969) one's family and kin are expected

---

\*"The research upon which this analysis was based was supported by U.S.P.H.S. grants #EF00654 and EC 00101. Kermit Schooler, Principal Investigator.

to provide the necessary support for one's morale or well-being. I am not studying the Black family as an institution.

In this presentation, I will (1) identify and describe the Black older person, and (2) examine their social participation (in comparison with White aged) with their family and kin.

Social participation is here defined as the activity with other people that contributes to one's social relationships which he comes to depend on for emotional support and responsiveness and which maintain him in many subtle ways (Lehr and Rudinger 1969).

To provide a framework for this examination, one assumption is made and one hypothesis is posed. It is assumed that:

There are demographic differences between Black and White elderly; that is, income, marital status, education, occupation, and religion when examined by sex, residential location and race are expected to differ significantly.

It is hypothesized that:

Household situations are different for Black and White elderly. It is proposed that these differences show that the elderly Black are more likely to live alone or in household situations without a spouse and that White elderly are more likely to live with a spouse as a couple, or in household situations with a spouse. It is further hypothesized that Black elderly persons living alone or without a spouse have a low state of morale or well-being in old age.

The data utilized in this analysis is from the data collected from professionally administered questionnaires, in a National Senior Citizen Survey carried out during 1968 by the Brandeis University Heller Research Center as part of its research program of measuring "Residential Physical Environment and Health of the Aged". The program was under the direction of Dr. Kermit Schooler.

The universe of the study consisted of the non-institutional population of persons 65 years of age and older living in the continental United States (excluding the states of Alaska and Hawaii). A multi-stage pre-listed area probability sample covering persons 65 years of age and over living in households was drawn. Four-hundred Census Enumeration Districts and 798 area segments within these districts were selected in the first and second stages of the sample. The third stage of sampling, a prelisting of all households containing one or more persons 65 years of age and older was prepared for all but 29 of the 798 segments. This resulted in a listing of 51,523 listed households. A subsampling of these households revealed a total sample of 6,328 households in which eligible respondents were contacted. In those households where more than one person was eligible for interviewing a further sample was selected so that no more than one individual per household would be interviewed. The total number of completed interviews acceptable to Audits and Surveys was 4,007. This was further reduced to 3,996

because of technical difficulties encountered in the coding. The subsample used in this analysis includes only Blacks and Whites  $N = 3827$  (Whites  $N = 3340$ , Blacks  $N = 487$ ) and does not include others (Oriental, Spanish, Puerto Rican, etc.  $N = 169$ ). (Audits and Surveys 1968)

However, the sample numbers here are corrected for a more representational accuracy. (Sellitz, Jahoda, Deutsch and Cook, 1966). The weighted and corrected numbers in this study will appear as: Total  $N = 3827$  (Black  $N = 408$  and White  $N = 3419$ ).

Getting to know the Black elderly person from literature is most difficult. In the field most related to the social process of aging, Social Gerontology, very little can be found (Rubenstein 1971, Jackson 1971). Seeking the Black elderly in the writings on family life is equally non-productive. Not only are the elderly missing, but Billingsly (1970) also finds "no area of American life more ignored, more distorted, or more systematically disvalued than the black family life." In writings based solely on the Black family (Bernard 1966, Frazier 1968, Billingsly 1968, Willie 1970), little or no attention is paid the elderly. Some meager comments can be found in early research on Blacks and in historical writings on Blacks. (Dubois 1908, Johnson 1930, Apthekar 1943, Davis, Gardner and Davis 1948, Kardner and Ovsey 1951, Quarles 1961, Drake and Cayton 1962, Wade 1965, Franklin 1969, Meir and Rudwick 1970).

When W.E.B. Dubois studied the Negro family about 65 years ago (Dubois 1908) he felt a need to connect present conditions with the African past, "This" he explained "is not because Negro-Americans are Africans, or can trace an unbroken social history from Africa, but because there is a distinct nexus between Africa and America which, though broken and perverted, is nevertheless not to be neglected by the careful student."

In an attempt to be the careful student I did pursue the nexus between America and Africa to discover the elderly in Black Africa. This too was not productive because the term age is commonly understood to refer to social and not necessarily to physical age; in many cases this "social age" will coincide approximately with physical age, but in others they will vary widely. Age-mates are thus not persons who are of the same biological age, but by definition persons who are initiated together, or during the same period, into a social group of a certain type, and that is known in the literature as age-set, age-class or age-grade. (Prins 1953, Forde 1951, Simmons 1945). Not being able to identify age chronologically and encountering cultural and environmental behavior most different from that experienced in America limits what one can transfer to the knowledge about Black elderly in America.

Nevertheless, there is some knowledge about the Black elderly that can be built on. Some is impressionistic and ranges from one view that Blacks bring to their older years

"a whole lifetime of economic and social indignities, a lifetime of struggle to get and keep a job, more often than not at unskilled hard labor, a life time of overcrowded, substandard housing in slum neighborhoods, of inadequate medical care, of unequal opportunities for education and the cultural and social activities that nourish the spirit, a lifetime of second-class citizenship, a lifetime of watching their children learn the high cost of being a Negro in America." (National Urban League) While on the other hand an expressed view is "that black aging populations are inclined to be robust, healthy, and well adjusted." (Elian 1970)

Beyond the impressionistic there is some data from governmental census information that when put together can portray a generalized picture of the Black elderly. (Demographic Sources)

This profile shows that White persons make up less than 90% of the total population but 92% of the older population. This is attributed to racial difference in life expectancy. (Life expectancy for whites is 73.7 for females and 66.9 for males but for the non-whites is 70.5 and 63.5.) At the end of 1962, persons aged 65 or over in the U.S. numbered about 17 1/2 million, ~~or 87% were non-white (90% of the non-white are Black).~~ Non-whites were slightly more than 11% of the total American population but only 6% of the 65 plus population. At the present time, Whites make up about 93.9%

of the aged population. About half of the Black elderly will reside inner city of the metropolitan area (48%) with 13% residing in the suburbs. While 39% of the Black elderly will reside in non-metropolitan areas, of these only 6% will be found on farms, leaving 33% in non-farm non-metropolitan areas.

The low income status of the adult during his working years presages his low income status in old age. An unemployment rate of twice that of Whites, low educational attainment, market place discrimination, and other such factors are also contributive to low income among Blacks. The 1963 survey of the aged reported 1/2 of the non-white couples sixty-five and over had money income in 1962 totaling less than \$1,960. It further reported total (median) money income of White: married couples \$2,955, non-married men \$1,390 and non-married women \$1,060 and Non-White: married couples \$1,960, non-married men \$1,100 and non-married women \$795. In 1964, the median income of Black families (\$3,839) increased by 11% over the 1963 level, but was still 44% below that of the White families. Among Black older Americans 42% of the families headed by older persons and 75% of the individuals living alone or with non-relatives are living in poverty. (For Whites this was 17% families and 47% alone were impoverished). Blacks receive proportionately less Social Security, less Railroad Retirement, less investment income, and less income

from insurance and considerably less savings than Whites. To the contrary, Black elderly receive more Public Assistance and depend more on their own and/or a spouses income. There are significant differences in the marital status of the White and Black populations. Relatively fewer Blacks were married and among the married, there was greater likelihood that the married couple would not be living together. One out of the 5 Black married women are living apart from their husbands but only 1 of 2 White women are in this situation.

Because of their shorter life expectancy and a considerably higher marriage disruption rate, fewer Blacks aged 65 and over than White persons of that age are still married and living with a spouse. Considerably more of the Black women have no husbands' income to count on in old age. Because of their inferior earning capacity, more Black men than White men never marry and so face retirement and old age alone, with no possibility of turning to a wife or grown children to ease health care or financial stress....It has also been noted that because a non-white woman is more likely to be non-married, that is, minus a husband, by the time she reached age 65, and if she does not qualify for a benefit in her own right through her own work record for social security benefits, she may well have to look for public assistance....Because relatively more of the Black recipients of old-age assistance (public assistance) live in low income South, Black recipients as a group receive somewhat smaller assistance payments.

The Decennial Census of 1960 shows relatively fewer of the Black aged enjoying the benefit of home ownership and relatively more living in housing units needing repair or without adequate facilities, dilapidated, that is, housing that "in its present condition endangers the health, safety or well being of the occupants". Because older people in general continue to live on in quarters they have occupied for some time, the inferior housing status of the Black aged is undoubtedly a continuation of earlier disadvantage rather than solely a reflection of current inadequate income. The Black enters upon retirement (more forced than voluntary), with little savings, more often than not without an owned home, and with little else in the way of private pensions or other resources to add to any public program benefits to which he is entitled.

For the older Black in our society, the experience of being without cash, food and comfort is not new -- he has lived with it all his life. But in his later years, he has less physical vigor, fewer resources than ever and, worst of all, he is finally confirmed in his lifelong hopelessness. Blacks are more likely to die before 65 (sixty-five). They are more subject to disabling illness, get less adequate medical care and less assistance in meeting its costs. The pattern of health facilities and services in hospitals, clinics, homes, etc., have not allowed for adequate care of the Black.

These facts and interpretations may contribute to a description and image of the current phenomenon of the Black elderly.

Now, let me add further to this description from my assumption that there are demographic differences between Black and White elderly. In my study, I have found:

AGE

The ages of this Black and White sample exhibits a declining proportion in the successive age groups; one that would be expected of an aging population.

Table 1-1

<u>Age</u>	<u>Age Array by Race</u>	
	<u>Black</u> <u>N=408</u>	<u>White</u> <u>N=3419</u>
65 to 69	37.7%	34.9%
70 to 74	30.8	29.6
75 to 79	17.8	20.8
80 to 84	8.3	9.9
85 to 89	3.4	3.2
90 plus	1.9	1.1
Not ascertained	.3	.6
	<u>X Y</u>	<u>X Z</u>
Total	100.2	100.1

X inflated figure because of rounding errors in computation

Y mean 72.9, median 71.7, standard deviation 6.6

Z mean 73.0, median 71.7, standard deviation 6.3

This population is fairly reflective of the ages in the national population, as of 1969, where it has been determined that sixty-three percent of the population (63%) will be under 75 years of age, thirty-one percent (31%) are 75 to 84 and six percent (6%) are 85 plus. (Brotman 1969)

Table 1-2

Age by Race in Comparison with National Norm

<u>Age</u>	<u>National Norm</u>	<u>Sample Black N=408</u>	<u>Sample White N=3419</u>
65 - 74	67%	68.5	64.5
75 - 84	27%	26.1	30.7
85 +	6%	6.3	4.3
NA	--	0.3	0.6
<b>TOTAL</b>	<b>100%</b>	<b>100.2%</b>	<b>100.1%</b>

The differences between the Black and White age groupings do not appear to be significant. However, contrary to the finding that life expectancy for Whites is seven years (7) greater than Blacks, (Fact Sheet 1967) the Black sample is 2% higher than the Whites in the 85+ age category where it would be expected to be lower.<sup>1</sup>

<sup>1</sup> The national norm is based on total population figures that include institutionalized elderly. Since our sample is based on only non-institutionalized elderly, and that Blacks have not been found in many institutions, the comparison would tend to understate the White elderly position. Considering that only 5% of the elderly are in institutions, the understatement would be minimal.

RACE

The racial (Black and White) composition of this sample is: White 89% (N = 3419), Black 11% (N = 408). While White persons make up less than 90% of the total population but 92% of the older population, (AOA Public No .46) the 11% Black is 3% higher than the 8% national norm. The racial decrease in aging is expected because of a difference in life expectancy; however, this is not found here.

When examining the male-female proportion within the racial grouping:

Table 1-3

Sex by Racial Grouping

	<u>Black</u>	<u>White</u>
Male	37% (N=151)	40% (N=1381)
Female	63% (N=257)	60% (N=2038)
Total	100% (N=408)	100% (N=3419)

The male-female ratio for both groups is consistent with what would be expected in a random sample.

SEX

The sex distribution of the sample is consistent with the national population; in the nation 43% are men and 57% are women. (Facts on Aging AOA No 146)

Table 1-4

Sex in Comparison with National Norm

	<u>National Norm</u>	<u>Study Sample (N = 3827)</u>
Male	43%	40% (N=1532)
Female	<u>57%</u>	<u>60% (N=2295)</u>
Total	100%	100%

Residential Location<sup>1</sup>

Sixty-nine percent (69%) of the sample resided in a non-rural location and thirty-one percent (31%) resided in a rural location. While U.S. Government statistics (Facts on Aging AOA No 146) show, for the elderly, a 60% metropolitan and 40% non-metropolitan residential pattern, a comparison with the sample cannot be made, due to different area definitions.

Sex by Residential Location

The sex distribution in the rural and non-rural location reflects a proportional difference similar to the male and female difference found in the total sample population (female 60% and male 40%).

Table 1-5

Sex by Residential Location

	<u>Rural (N=1180)</u>	<u>Non-Rural (N=2647)</u>
Female	58% (N=682)	61% (N=1614)
Male	<u>42% (N=498)</u>	<u>39% (N=1033)</u>
Total	100%	100%

<sup>1</sup>This designation was determined by the population of the location in which respondent resided. A location of over 2500 was designed as non-rural and an area under 2500 was designated as rural.

Race by Residential Location

A small difference in racial distribution is found between rural and non-rural locations.

Table 1-6

Residential Location by Race

	Black (N=408)	White (N=3419)	Total
Rural (N=1180)	.09 (N=106)	.91% (N=1074)	100%
Non-rural (N=2467)	.11 (N=302)	.89% (N=2345)	100%

Race and Sex by Residential Location

To gain a more instant perspective of this sample population the two previous tables are combined:

Table 1-7

Race and Sex by Residential Location

	MALE (N=1532)		FEMALE (N=2295)	
	<u>Black</u>	<u>White</u>	<u>Black</u>	<u>White</u>
Rural	3% (N=44)	30% (N=454)	3% (N=62)	27% (N=620)
Non-Rural	<u>7% (N=107)</u>	<u>60% (N=927)</u>	<u>8% (N=195)</u>	<u>62% (N=1418)</u>
Total	10%	90%	11%	89%

Income

The analysis of income will reflect the economic difficulties of elderly and quite dramatically the poor plight of the rural Black.

The income reported here is inclusive of all income from different sources:<sup>1</sup>

Table 1-8

Male Income - Controlled for Location and Race

<u>Income</u>	<u>MALE</u>				<u>All Males</u>
	<u>Rural White</u>	<u>Non-Rural White</u>	<u>Rural Black</u>	<u>Non-Rural Black</u>

Chi Square = 167.83 p < .001

<sup>1</sup> This information was gathered with the query that "We're trying to study the many different sources of income among people 65 years of age and older. Would you please tell me if you (and your husband/wife) have received any income during the past 12 months..from the following sources (read list slowly and check source below) includes: wages, salaries, fees, profits, rents, insurance payments, interest and dividends, pensions, retirement, soc. sec., OAA, vet benif., unemployment benif., and others and family subsistence allowances. Above were totaled for Total Yearly Income."

Table 1-9

Female Income - Controlled for Location and Race

<u>Income</u>	<u>FEMALE</u>				
	<u>Rural White</u>	<u>Non-Rural White</u>	<u>Rural Black</u>	<u>Non-Rural Black</u>	<u>All Females</u>
Under 1,000	20.5	16.6	65.8	33.8	20.8
1,000 to 1,999	30.4	25.5	14.3	34.3	27.3
2,000 to 2,999	31.1	35.5	16.6	13.7	31.9
3,000 to 3,999	7.9	7.6	2.7	8.8	7.7
4,000 to 4,999	3.0	6.2	0.6	1.8	4.8
5,000 to 6,999	4.8	4.4	0.0	2.6	4.2

Column Total	100.0	100.0	100.0	100.0	100.0

Chi Square 183.44      P < .001

According to our figures, the Black condition, both male and female, is strikingly impoverished. When considering that 40% of the elderly are living in poverty<sup>1</sup> and that 71.1% of the rural Black males and 80.2% of the rural Black females are in poverty, the difference is most significant. We find that almost no rural Black elderly have earnings beyond \$4,000, with very few non-rural Blacks exceeding that figure. We also find that rural incomes are lower than non-rural incomes, female incomes are lower than male incomes. It can readily be concluded that the differences between Black and White incomes are significant and the Black incomes are far below that of Whites.

#### Educational Attainment

Considering that half of the older people never got to high school and that 17% are functionally illiterate, (AOA Publication No 146) and the median years of education for persons over 65 is eight; one can expect of the elderly low educational attainment.

---

1

Commissioner John Martin, U.S. Department of HEW, Admin. of Aging, testified before the sub-committee on aging, Sept. 1969, and stated that thirty percent (30%) of the population who are sixty-five (65) and over live below the poverty line established for purpose of the Social Security Administration Poverty Index and another ten percent (10%) have incomes only slightly above the poverty line, making a total of forty per cent (40%) of this age group who are in poverty or near poverty.

Chi Square = 227.22 < P .001

Tables 1-10 and 1-11 show for the White population an approximation of the census expectation (Fact Sheet on Aging AOA No .46) of 65% with 8 years or less, 25% with high school, and 10% with college, with a higher attainment for the White non-rural male and female over their rural counterparts.

However, with the Black population there is a significantly lower educational attainment, high proportions of no formal education. The Black rural male and female is less educated than his or her non-rural counterpart and the rural Black male attaining

a level slightly lower than the female and lower as well to the Black male and female in non-rural locations. We can conclude, from observing our frequency distribution, that the Whites have a higher educational attainment. The Black rural male is the least educated. We also note that males show a slightly higher educational attainment than females in all categories excepting the Black rural where the female has a higher educational level.

### Religion

In the total population of the United States, for all ages of those indicating a religious preference, it has been found that 66% are Protestant, 26% are Catholic, 3% are Jews and 5% are others. (Miller 1964) In this study we find:

In the examination of religious preference we do find that the female tend to have more religious preference than do males and that the group with the highest preference is the Black Rural (both Male and Female). We also find the Black and White predominantly Protestant with the low percentage of Black Catholics to be found in the non-rural location. The small Jewish population is located in the non-rural area. Catholic preference is definitely higher in the non-rural, while Protestant preference tends to be higher in the rural location. Of those indicating no religious preference, we find the rural white male the highest with the non-rural Black male the second highest.

Marital Status

That most men are husbands and most women are widows is also a truism in this study. This total sample does approximate the national census: (Brotman 1969)

Table 1-14

MARITAL STATUS

	<u>Men</u>	<u>Women</u>
Married	71.3%	36.0%
Widowed	19.5	54.4
Divorced Separated	2.6	1.9
Never Married	6.6	7.7

We find that Blacks have a lower marriage and a higher widow rate than do Whites with a highly significant difference in the Black non-rural category. These statistics do indicate the non-rural (Black and White, male and female) have a higher never married percentage than the rural. Rural elderly tend to have a greater married status and lower widowed status than do the non-rural. Blacks, in most categories, have a higher divorced and separated status than whites, excepting with the rural Black females who show an extremely low divorce status. This data also shows a higher separation status for Black male and females with a significant higher rate for non-rural Black male and females. It can be said that Whites are more married and less widowed than Blacks and that Blacks have a higher incidence of divorce and separation than Whites, ~~and that more Blacks never marry than Whites.~~

Occupation

As would be expected, the data does reflect male and female occupational differences.

Table 1-17

Male Occupation - Controlled for Location and Race

Column Total	26.9	61.8	2.7	8.5	100.0

Of those persons that have no major job the male Black-White differences show that the non-rural Black is the highest and rural Black being the lowest. One could say that the rural Black male has always worked while the non-rural Black male may not have been fully and consistently employed.

---

\* These are corrected estimates due to coding errors  $X^2$  was not computed.

It is quite evident in this analysis that a high percentage of the rural Black males will be found statistically as common laborers and farm workers and the non-rural Black males as a laborers and service workers while the White elderly male is more likely to be found in manager, proprietor and craftsman, foreman roles. For the women there is a significant number of white (both rural and non-rural) not having major jobs, with fair percentages for Blacks as well. This would indicate (more so in rural areas and for white women) that the woman was in the home. We do find that for Black women, that their tasks would be found in service and common labor. It is also interesting to note that no Black rural women were found in clerical, sales and craftsman, foreman jobs and while a small percentage of Black non-rural women were in clerical, virtually none were found in sales and craftsman, foreman positions.

In occupation roles and tasks, for Blacks and Whites, there are most significant and distinctive differences.

#### Summary

It is most clear, and without equivocation, that there are significant demographic differences between the Black and White Elderly. The Black elderly may well be found in the upper reach of the later years where he or she was not expected. Contrary to other experiences, we do find the Black and White

racial composition in this sample similar to that of the national population and not giving rise to the assumption that the Black does not live to older age. The seven year mortality difference would not be evident here. We do find that the White elderly have higher incomes and that 70 to 80% of the Black elderly are in or near poverty. The Black have a lower formal educational attainment than do the White elderly and consistent with this finding, the Black is also found in greater proportions in the labor and service occupations. The Blacks are predominantly Protestant with some Catholics in the non-rural areas. While White elderly are also predominantly Protestants, they have a greater number with Catholic preferences. Blacks have a lower number now married than Whites and also more widows than Whites and Blacks will be found to be more separated and divorced than Whites. ~~More Blacks than Whites have never married.~~

I have posed the hypothesis that household situations are different for Black and White elderly persons; and that these differences are that elderly Black persons are more likely to live alone or in household situations without a spouse and that White elderly persons are more likely to live with a spouse as a couple, or in household situations with a spouse. And consequently, I proposed, that the Black elderly living alone or without a spouse have a lower state of morale or well being in old age, than do the White elderly who live with spouse in couples, or in household situations with a spouse.

This hypothesis was constructed in the realization that Blacks have been isolated (or prevented) from social participation. Edwards (1968) said that, "isolation under which the Negro lived in the U.S. provided serious attenuations in his community and institutional life, and, as a result, had a profound impact upon his self conception."

Is this so for the Black elderly in their primary social institution, their household situation.

In response to the question "Does anyone live with you here," this is what was found:

Table II -1

	<u>YES</u>	<u>NO</u>	<u>TOTAL</u>
White	75.5 (N=2576)	24.5 (N=835)	100%
Black	79.5 (N=324)	20.5 (N=84)	100%

This finding is most significant for it does contradict the assumption that the Black elderly are to be found more alone since they are more widowed, divorced and separated. Of course, this gives credence to Billingsly's (1968) advice that "the Negro family cannot be understood in isolation or by concentration on its fragments, or on its negative functions. The Negro family can best be understood when viewed as a varied and complex institution within the Negro community, which is in turn highly interdependent with other institutions in the wider white society."

When asked "how many people live with you here," it was found as follows:

	<u>One Person</u>	<u>Two Persons</u>	<u>Three, four or five</u>	<u>Six or more persons</u>
Black	37.0	18.6	13.9	6.0
White	54.6	12.4	7.5	.9

This data further reinforces the fact that the Black elderly are not as limited in their opportunity for social participation in their households as are the White elderly who live with fewer people.

When queried as to what relation are these people in the household to you and you to them, it was found that:

Table II-3

Singular Respondent with Extended Family	21.7	9.4
Singular Respondent with Augmented Family	6.2	3.3
Not Available	.7	.5
	<hr/>	<hr/>
TOTAL	100.2%	99.9%

To this point, we have found that Black and White elderly do live in different kinds of household situations, and that they are not as alone or isolated as is commonly thought. Now that we are at the point of testing the hypothesis, I wish to explain the form of the hypothesis. This conceptual form follows the

dictates of the general examinations and controversies on the Black family. Have not the so called "broken", "dis-organized", "matriarchial" or "one parent" family been the focus of Black family investigation? Our hypothesis follows this "normative expectancy" and attempts to test its validity. But in reality, my examination goes beyond this expectancy because I do believe that for the Black family and for the Black elderly, what Otto (1970) states is most profound:

"For many decades the overwhelming weight of our research has been concentrated on marital and family dysfunction and disorganization. We have studied or sought to treat the sick marriage and the sick family without any clear conceptualization or theoretical framework for what we mean by a "healthy" marriage or well-functioning family. Our efforts have focused on the pathology of the family, while neglecting family strengths."

With this caution, let us continue the examination. Are Black elderly who are not alone in household situations living without spouses and white elderly who are not living alone living in household situations with spouses:

	<u>With Spouse</u>	<u>Without Spouse</u>
<u>White</u>	55.4%	19.3%
<u>Black</u>	41.5%	37.4%

Yes, the White elderly when not alone are in household situations with a spouse moreso than Black elderly who are not alone.

Now to test the hypothesis: that Black elderly persons live alone or in household situations without a spouse and that White elderly persons live with a spouse as couples, or in household situations with a spouse. I do find that:

	<u>Alone or w/o spouse</u>	<u>Table II-6 With Spouse</u>	<u>Not Available</u>	<u>Total</u>
Black	58.0	41.5	.7	100.2
White	44.0	55.4	.5	99.9

Yes, the hypothesis is true, but not to the degree that would be expected considering the intensity of common expectation.

But how does this affect well being in old age. How are these household situations reflected in the older persons feeling about himself and his relationship to the world around him.

To measure the degree of well-being two morale factors were utilized.<sup>1</sup> Morale factor 1 reflects a transient response to external events and morale factor 2 accounts for the degree of sustained unhappiness.

---

<sup>1</sup> Due to limits of this paper the factor composition and weights are not explained. This information is available from the author upon request.

How is the state of well being for Black and White elderly when they live alone or with others? When examined by Morale 1 (transient response to external events) I find:

Table II-7

Does anyone live with you here by Morale 1  
by sex by race

		WHITE				BLACK			
		<u>Male</u>		<u>Female</u>		<u>Male</u>		<u>Female</u>	
		No	Yes	No	Yes	No	Yes	No	Yes
High Morale	1	16.2	10.8	10.6	6.3	21.5	10.5	12.3	10.5
	2	39.2	36.2	29.0	23.5	23.9	20.7	24.5	27.2
	3	21.7	25.9	26.4	28.9	13.9	25.6	30.3	24.4
	4	19.7	20.5	26.3	26.5	29.3	25.8	22.1	30.7
Low Morale	5	3.2	6.6	7.7	14.8	11.3	17.5	10.8	7.2
		<hr/>		<hr/>		<hr/>		<hr/>	
TOTAL		16.3	83.7	30.	70.	14.8	85.2	23.9	76.1
		100%		100%		100%		100%	

This finding indicates that with both Black and White elderly more females than males live alone. Contrary to the expectancy that alone = poor morale, I do find with both Black and White elderly that those living alone do have higher morales than those living with others excepting the Black female where the difference in household situation does not indicate a significant difference in morale.

There is no significant different between Black and Whites in their levels of morale as measured by the moral factor 1 (transient response to external events).

In examing the same household situations by Morale 2 (sustained unhappiness) I find:

Table II-8

Does anyone live with you here by Morale 2  
by sex by race

		WHITE				BLACK			
		Male		Female		Male		Female	
High Morale	1	No	Yes	No	Yes	No	Yes	No	Yes
		0.3	2.9	1.3	3.8	0.0	3.9	0.7	8.8
	2	18.7	41.1	24.3	34.5	29.5	40.7	27.7	27.1
	3	34.6	39.4	36.6	36.8	25.6	29.5	43.0	42.5
	4	30.8	11.8	24.1	17.9	29.7	18.1	21.4	16.2
Low Morale	5	15.6	4.7	13.3	6.9	15.2	7.7	7.3	5.4
		16.3	83.7	30.	70.	14.8	85.2	23.9	76.1
		100%		100%		100%		100%	

This finding indicates what would be expected, that, by living with others one would be happier. The racial difference, here again, is not significant with the exception of a higher morale for the Black female living with others.

Since I have gone way beyond my time and the last part of the hypothesis is most extensive, I will attempt to graphically summarize the findings . When the household situations were dichotomized and tested by morale it was found generally that:

Morale 1

(Transient Response to External Events)

	<u>Alone or situation without spouse</u>	<u>Situations w/spouse</u>
High	more	less
low	less	more

Morale 4

(Sustained unhappiness)

High	less	more
low	more	less

Since the data was not broken down by race (as yet) I can only report that the morale trends for the general population in selected household situations do show that when responding to the outside world the aged alone or in a family situation without a spouse may be more secure than the elderly who lives with a spouse or with a spouse in a family situation. When examining ones morale as measured by sustained unhappiness we find the opposite. However, the applicability of this finding by race will need to be examined at another time.

Conclusions:

1. The Black elderly are with us and their living conditions are in dire need of improvement.
2. The Black elderly are no more alone and isolated than are the general elderly population.
3. The emotional state of well-being is <sup>not significantly</sup> ~~no~~ different for Black elderly than for White elderly.

My research also prompts me to conclude that:

4. We must be quite critical in our acceptance of the generalities and myths surrounding the Black elderly, and demand more thorough examinations of our most neglected and unknown population.
5. The Black elderly person (and White elderly as well) are grown and matured adults who are at that stage of life, where, in the socialization process, they socialize others, rather than being socialized themselves. It is therefore incumbent upon us to recognize that the Black elderly must not be viewed as children and adolescents.
6. As with all populations, we should expect to find similarities and differences and strengths and weakness. And we must be aware that:

"Family research seems to have become particularly prone to the whole hearted endorsement of the 'cultural homogenization' theme and to the rejection of diversity as a conceptual alternative." (Heiskanen)
